

Honors chemistry Enthalpy

#9-4 Delta H of formation

Rules

1. Collect data
 2. Multiply by coefficient
 3. Sum all products
 4. Sum all reactants
 5. Subtract products from reactants

Thermodynamic values

1. Methanol (CH_3OH), Write the combustion reaction for methanol. (CH_3OH)

2. Conservation of energy method, solve for enthalpy.

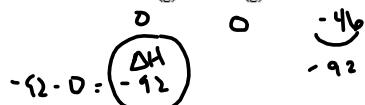

$$\Delta H_{rxn} = \Delta H_f(\text{products}) - \Delta H_f(\text{reactants})$$

$\begin{array}{rcl} 2\text{CH}_3\text{OH}(g) + 3\text{O}_2(g) & \rightarrow & 2\text{CO}_2(g) + 4\text{H}_2\text{O}(g) \\ -200 & 0 & -393 \quad -241 \\ \underline{-400} & & \underline{-786} \quad \underline{-964} \\ & & -1750 \end{array}$

$\Delta H = -1350 \text{ kJ}/\text{rxn}$

3.(brown581) Using the standard heat of formation data, in your workbook,

a. Determine the ΔH° for the following reaction: $N_{2(g)} + 3H_{2(g)} \rightleftharpoons 2NH_{3(g)}$

4. Some chefs keep baking soda, NaHCO_3 , handy to put out grease fires. When thrown on the fire, baking soda partly smothers the fire, and the heat decomposes it to give CO_2 , which further smothers the flame.

Using ΔH tables calculate change in enthalpy in kilojoules.

$$\begin{array}{cccc}
 -947 & -1130 & -285 & -393 \\
 \hline
 -1894 & & -1808 & +844
 \end{array}
 \quad \Delta H = +844$$

a) Calculate the standard enthalpy change for the combustion of 1 mol of benzene, C_6H_6
